

Title:

Forest story

Description

This project is an interactive story controlled by hand gestures. Using ml5.js handPose, the camera tracks the user's hands and turns them into characters inside the scene.

The story takes place in a mysterious forest. One hand controls a girl who is exploring the space, while the other hand controls a monster that appears and follows her. When the second hand opens, a tool appears, allowing the girl to defend herself or fight back.

The interaction creates a short performance where the girl and the monster are in tension. The user can decide how the story unfolds—whether the characters move closer, avoid each other, or confront each other—just by changing hand gestures.

Instead of only watching a story, the user actively performs it. The goal of this project is to turn a simple narrative into an interactive experience where movement and gesture directly shape what happens in the scene.

use:

Right hand

Left hand

Space key

AI explanation:

I used AI in this project mainly to help with coding problems. I asked AI how to create a parabolic trajectory so that the bomb could move in a curved path and bounce before exploding. I also asked for help with implementing the monster's health system, such as how to reduce its health when it gets hit by the bomb.

The overall idea, design, and interaction were created by me, and AI was only used as a tool to support the technical parts.
